

## SOLVING LINEAR SYSTEMS USING SUBSTITUTION

The substitution method is another way to solve a linear system using ALGEBRA!  
The method requires you to write both equations in the slope  $y$ -intercept form.

$$y = mx + b$$

**Recall:** Solving a linear system means finding the POINT OF INTERSECTION.

**To find the POINT OF INTERSECTION  $(x, y)$ :**  
**FIRST find the  $x$  component (STEP 1)**  
**THEN find the  $y$  component (STEP 2)**

### METHOD FOR STEP 1 – finding the $x$ component of the POI $(x, y)$

- \*1\* Make sure both equations are in  $y = mx + b$  form; if not, rearrange them into this form.
- \*2\* Both equations equal  $y$ , so they are equal to each other!  
So....set the right side of each equation equal to each other!!!.
- \*3\* Solve for  $x$ .

**EXAMPLES:** Solve for  $x$  for the following linear systems:

$$\begin{aligned} y &= 2x + 7 \\ y &= -x - 11 \end{aligned}$$

$$\begin{aligned} 6x + 2y &= 12 \\ 4x - y &= 5 \end{aligned}$$

$$\begin{aligned} x + y &= -2 \\ x - y &= 6 \end{aligned}$$

**METHOD FOR STEP 2 – finding the  $y$  component of the POI  $(x, y)$** 

\*1\* Use the equation of the line in the  $y = mx + b$  form

\*2\* Substitute the value of  $x$  (from STEP 1) into that equation

\*3\* Solve for  $y$

**EXAMPLES** - Solve the following equations by substituting in for the  $x$  value

a)  $y = x + 5$  when  $x = 2$

b)  $y = 6x - 3$  when  $x = -5$

c)  $y = 3x + 8$  when  $x = 7$

d)  $y = -9x - 25$  when  $x = -4$
